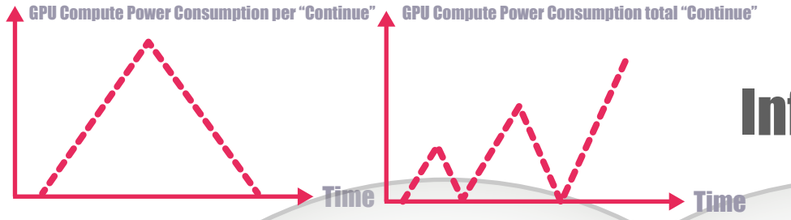
Dynamic Type: Linear Accumulation + No Decay

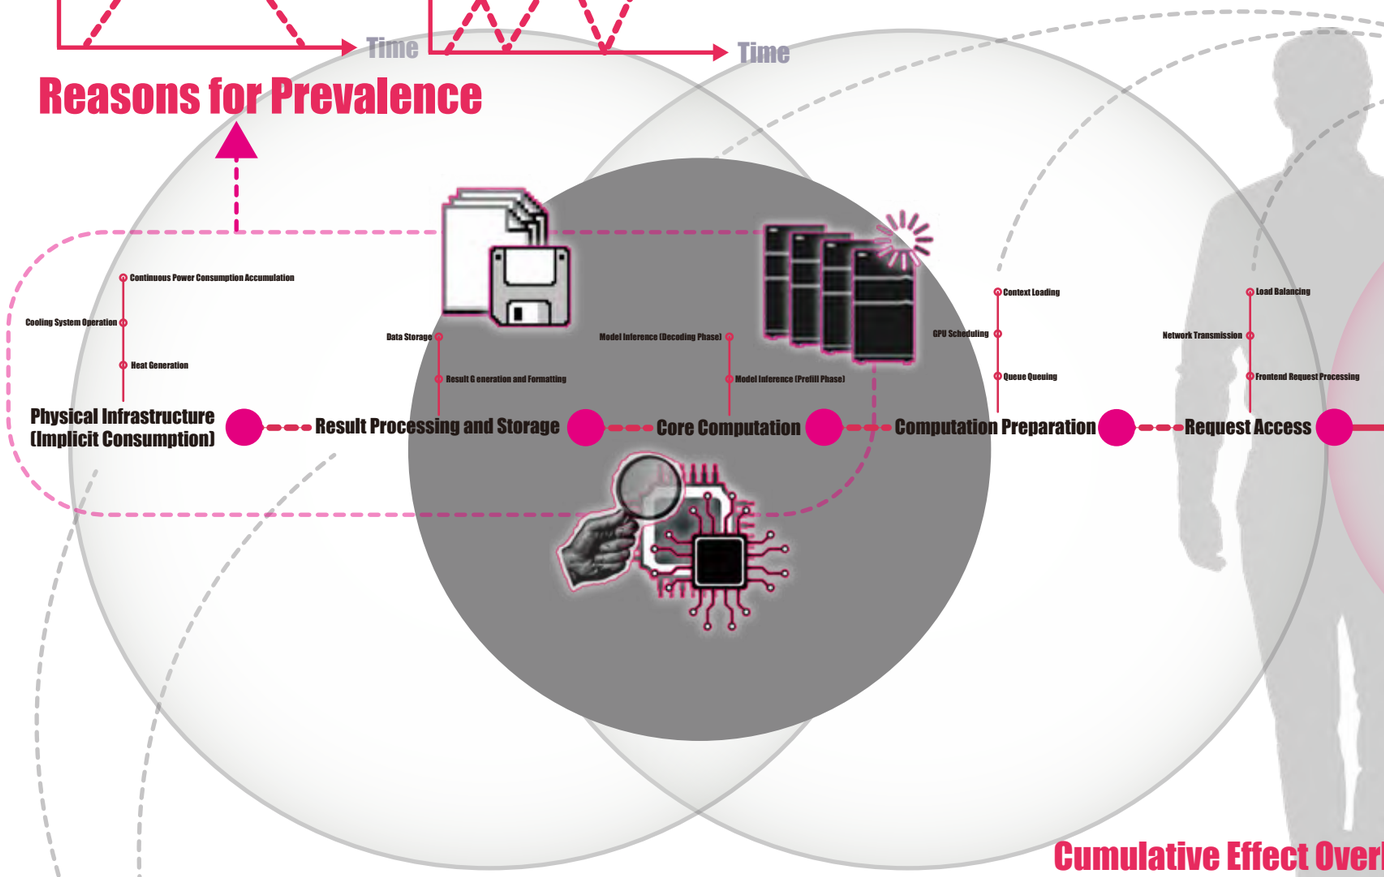
Trigger for Escalation: Each time the user inputs "continue" serves as a trigger. Since there is no feedback mechanism for "stop" or "quality threshold met," escalation is entirely driven by user intent until the user actively ends the session.

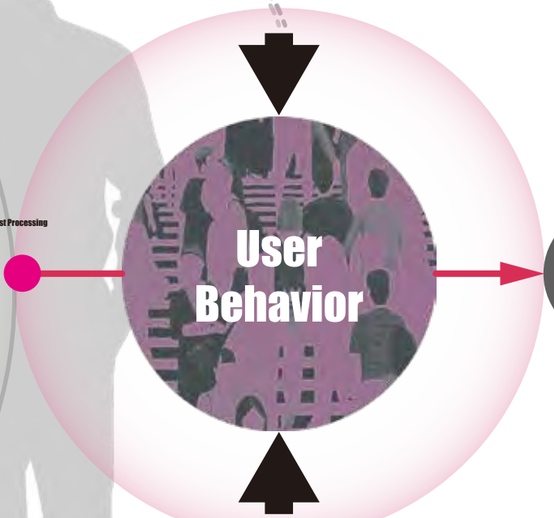


Reasons for Prevalence

Behavior Pattern
REPEATED

Infrastructural Process Layer





1. Cognitive Inertia: Users fully delegate the responsibilities of ideation, structural design, and quality control to the AI, assuming only the role of a "supervisor."

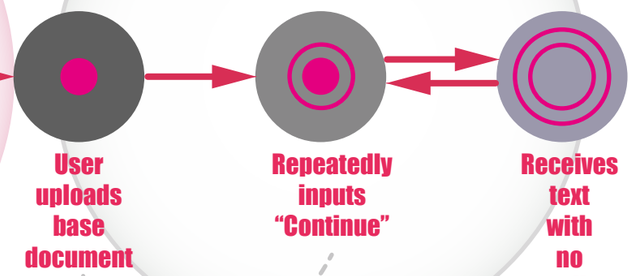
2. Low Barrier to Entry: The input cost is extremely low (like'a two-word command'), yet it provides a sense of satisfaction from seemingly "continuous output."

3.Perceived as "Free": Users are unaware of the computational resources invoked with each "Continue" command, mistakenly believing it to be a feature with "unlimited refills."

Reasons for Prevalence

User Behavior Layer

Behavior Pattern
REPEATED



Sources of Frictionlessness

1. Zero Cognitive Load: No need to formulate language or consider the next direction.

2. Instant Feedback: With each click of "Continue," the text extends immediately, creating an illusion of "on-demand responsiveness."

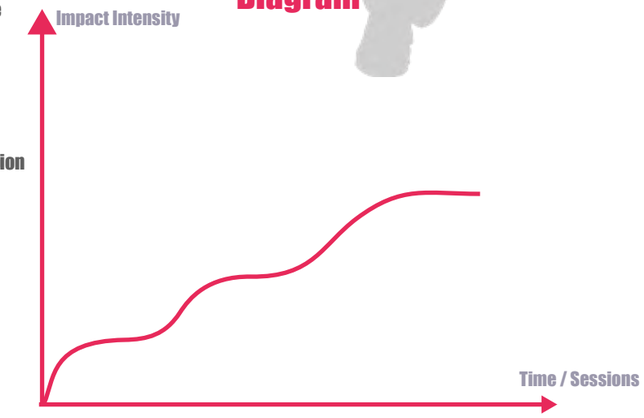
Atmosphere: Carbon Emissions + Climate Change
Biosphere: Ecosystem + Biodiversity Impacts

Hydrosphere: Water Consumption + Water Pollution

Lithosphere: E-waste + Mining

Planetary Consequence Layer

Cumulative Effect Overlay Diagram



Why This May Become Design Material

1. **Design Intervention Point:** A real-time carbon footprint estimator can be introduced in the interface, displaying the environmental cost of each "continue" instruction.
2. **Quality Threshold Mechanism:** When continuous "continue" instructions are detected and content quality shows no significant change, proactively prompt the user with a suggestion such as "Would you like to adjust direction or stop generation?"
3. **Intermittent Deceleration:** Introduce micro-delays or gentle prompts (e.g., "Resource-friendly mode") to break the illusion of "zero friction" and allow users to re-establish awareness of the generation process.
4. **Session Summary:** After the session ends, generate a "resource usage report" that includes estimated carbon emissions, water consumption, amount of redundant text generated, etc., transforming invisible consequences into visible feedback.
